Research Activities

Performance and Dependability Analysis	■ Performance and dependability analysis of large-scale and complex systems using data analysis, stochastic formalisms (queuing networks, Petri nets, and Markov chains), simulation (discrete-event and agent-based), machine learning, and experimental evaluation.
Cloud Computing	■ Profiling and modeling of virtual resources and microservice design patterns for performance prediction and optimization. These models consider bursty workloads and allow meeting objectives defined on the latency distribution.
Cyber-physical Systems	■ Analysis of architectural patterns and coordination mechanisms to optimize the performance of systems whose space is dynamic and agents exhibit malicious behaviors.
Uncertainty Propagation	■ Analysis of stochastic models to investigate how the uncertainty on input parameters propagates through a model and affects output measures.
